

What Is Claimed Is:

1. An electronic equipment system comprising:

5 a remote controller for transmitting a remote control signal containing a time data signal; and

an electronic equipment for receiving said remote control signal to correct time information,

said electronic equipment comprising:

10 receiving means for receiving said remote control signal;

displaying means for executing the blinking display, for a predetermined period, of the time represented by said time data
15 signal; and

correction means for correcting time information based on said time data signal.

2. The electronic equipment system according to Claim 1, wherein said correction
20 means measures a time which has elapsed since the reception of said remote control signal, and corrects time information based on the time obtained by adding the time which has elapsed since reception of the remote control signal to
25 the time represented by said time data, after said displaying means has finished the blinking

display process.

3. The electronic equipment system according to Claim 1, wherein said electronic equipment further comprises a key, button or switch for executing a predetermined process, and said displaying means finishes the blinking display process when said key, button or switch is pressed.

4. The electronic equipment system according to Claim 2, wherein said electronic equipment further comprises a key, button or switch for executing a predetermined process, and said displaying means finishes the blinking display process when said key, button or switch is pressed.

5. The electronic equipment system according to Claim 1, wherein said electronic equipment is a camera.

6. A time correction method for correcting the time of an electronic equipment based on a remote control signal transmitted from a remote controller, comprising the steps of:

a remote control signal transmitting step wherein said remote control signal containing a time data signal is transmitted from said remote controller to said electronic equipment,

a displaying step wherein displaying means of said electronic equipment executes the blinking display, for a predetermined period, of the time represented by said time data signal, and

a correction step wherein time information is corrected based on said time data signal.

7. The time correction method according to Claim 6, wherein, in said correction step, there is measured a time which has elapsed since the reception of said remote control signal, and time information is corrected based on the time obtained by adding the time which has elapsed since the reception of said remote control signal to the time represented by said time data signal, after said displaying means has finished the blinking display process.

8. The time correction method according to Claim 6, wherein, in said displaying step, said displaying means finishes the blinking display process, when the key, button or switch of said electronic equipment for executing a predetermined process is pressed.

9. The time correction method according to Claim 7, wherein, in said displaying step, said displaying means finishes the blinking display

process, when the key, button or switch of said electronic equipment for executing a predetermined process is pressed.

10. The time correction method according to
5 Claim 6, wherein said electronic equipment is a camera.
